Milk SA foreword

The purpose of this publication is to make information available on the structure and performance of the dairy industry, with a view to promoting optimal development to the benefit of the South African dairy industry and consumers.

Milk SA is proud to present this publication, which was made possible especially through the contributions of the persons or entities sharing their information via the statutory regulations, the SA Milk Processors' Organisation (Sampro), the Milk Producers' Organisation (MPO), and the Milk SA Advisory Committee. A special word of thanks to the MPO for compiling the information contained in *Lacto Data*.

Executive summary

South Africa's milk intake for 2017 is estimated at 3 245 000 t, 2,7% more than in 2016, and 2,3% more than in 2015. South Africa imported 83 504 t of dairy products in 2017 (up 44% on 2016) and exported 48 627 t of dairy products (3,2% less than in 2016).

Dairy product prices remained highly volatile during 2017. Based on the Global Dairy Trade Price Index, product prices in February 2017 were 90% higher than at the low turning point in August 2016, and marginally down on February 2016. Prices increased to mid-2017 and then declined to January 2018. Butter prices increased during 2017 to above US\$6 000/t (R79 380/t), but subsequently declined to US\$4 800/t (R59 040/t) in January 2018.

INTERNATIONAL SITUATION

Global economic growth

According to the International Monetary Fund (IMF), global economic activity is still improving. The global economy is estimated to have grown by 3.7% in 2017. Improved economic growth was experienced in nearly all areas, with surprisingly high growth in Europe and Asia. The global economy is expected to grow by 3.9% in 2018 and 2019. Global growth momentum and the impetus of changes in United States (US) tax policy are the main drivers of increased growth.

In the developed world, higher growth is expected in the US, driven by tax reform and improved external demand. In several European countries higher growth is expected as both domestic and external demand improves. Developed countries in Asia will also grow at faster rates than previously expected as global trade improves.

Emerging countries in Asia will continue to grow at about 6.5%, but growth in China is expected to moderate slightly. Accelerated growth is also expected in the developing countries in Europe, Latin America, North Africa, and the Middle East. In sub-Saharan Africa growth is expected to improve from 2.7% in 2017 to 3.3% in 2018 and 3.9% in 2019. The IMF still expects the South African economy to grow at 0.9% in 2018 and 2019. Recently released figures show that the South African economy grew by 1.3% in 2017.

Global food prices

Global food prices remain highly volatile. The Food Price Index of the Food and Agricultural Organisation of the United

Nations (FAO) fell by 2.4% from January 2017 to January 2018. Meat and cereal prices increased by 7.4% and 6.3%, respectively, while the prices of dairy products decreased by 6.8%, and sugar prices by 30.4%. Overall, 2017 saw huge volatility. Sugar prices decreased by 36% from the peak in October 2016 to January 2018. The FAO Dairy Price Index ranged between a low of 184 in April 2017 and a peak of 224 in September 2017. The sharp increase from April 2017 to September 2017 was caused by lower production and uncertainty about future production growth in New Zealand.

NEED TO KNOW

A FIRING RECOVERY

the projected pickup in global growth accelerates

Figure 3a: International FOB dairy product prices, US\$/t, Jan 2010-Feb 2018
(source: USDA)

Figure 3b: International FOB dairy product prices, R/t, Jan 2010-Feb 2018
(source: USDA, Reserve Bank)

International dairy product prices

A substantial gap developed between fat and protein prices in 2016 and this increased during 2017. Global dairy product prices fell in 2016 as a result of the increased supply and weaker demand in 2014, 2015, and the beginning of 2016. Global skimmed milk powder and butter prices reached a historic low early in 2016, with prices below US\$1 800/t for skimmed milk powder (SMP) and US\$2 600/t for butter. After reaching this low, SMP and butter prices no longer followed the same trend. Significant stock levels, especially in the European Union (EU), limited the increase in SMP prices, while the increased demand for full-cream dairy products and butter resulted in a sharp increase in butter prices, which reached

an all-time high of US\$6 000/t in New Zealand and exceeded US\$8 000/t in Europe. Full-cream milk powder (FMP) prices followed the same trend as butter prices. Prices decreased sharply to the end of 2017 and have since improved slightly.

International raw milk producer prices

Oversupply in various regions resulted in a decrease in producer prices at the end of 2015 and the beginning of 2016. Prices have slowly recovered since then, with higher demand pushing product prices up. Producer prices recovered in 2017, driven mostly by higher butterfat prices and the slow growth in demand in many exporting countries.

World milk production

The 2.2% growth in milk production in 2015 surprised analysts because lower milk production growth was expected. In 2016, lower producer prices resulted in a much slower production growth of 0.9%, which is significantly lower than the average annual growth rate of 2.1% recorded since 2005. Total production during 2016 is estimated at 826 million tonnes.

“Growth was slower for cow’s milk than for other types of milk. Cow’s milk production increased by only 0.5% year on year.”

Growth was slower for cow’s milk than for other types of milk. Cow’s milk production increased by only 0.5% year on year. The slow growth was the result of negative growth in South America (-5.3%) and Oceania (-3.3%). Slow production growth in the EU was the result of negative growth in the top three countries, Germany, France, and the United Kingdom (UK), as well as in Russia and the Ukraine. Climatic factors as well as farmers’ reaction to lower

producer prices were the main reasons for the lower production growth. Lower production in the EU was also encouraged by a European Commission scheme that paid farmers a subsidy of €0.14 (R2.04) per kilogram for undelivered milk. An estimated 48 000 farmers participated in this scheme and it resulted in an 861 000 t reduction in deliveries to dairies. In the US, a positive milk-to-feed price ratio resulted in robust production growth in 2016. Despite a reduction in producer prices during 2016, production growth remained resilient (Table 2).

Production of dairy products

Overall, cow’s milk deliveries to dairies decreased by 0.1% in 2016. This is the first decrease in milk deliveries in many years. Sluggish growth in milk production resulted in slow growth in the production of dairy products in 2016 and early 2017. Production recovered later in 2017 and a normal growth rate of about 1.8% in output is expected for 2017. Global production of packaged milk and fermented dairy products increased by 1.0% and 3.2%, respectively. These products are less traded internationally than the concentrated products and usually follow population trends more closely.

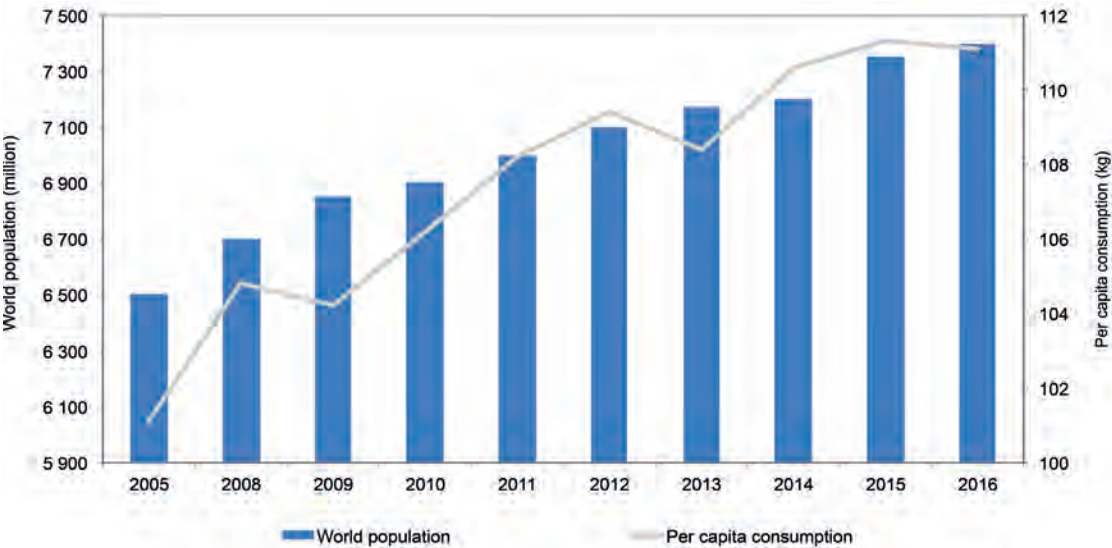

Figure 7: Annual increase in dairy demand, 1997-2018
(source: IFCN Conference 2017, *2017, 2018 IFCN projection)

Globally, cow's milk cheese production amounted to 20,5 million tonnes, an increase of 1,8% from 2015. Total cheese production amounted to about 23 million tonnes. Cheese production grew at a rapid rate in the EU.

Butter and butter-oil production increased by 1,7% from 2015 to 2016 and is estimated at over 11 million tonnes on a butter-equivalent basis. In spite of fast demand growth, butter production only grew by 1,7% compared to the long-term growth of 3,0% per year since 2010. Slow production growth resulted in shortages in late 2016 and in 2017.

New Zealand, the world's biggest producer of FMP, reduced their production in 2016. The same trend was followed by China and the South American countries. This resulted in a sharp decrease (5,7%) in full-cream milk production. Skimmed milk production also decreased as a result of the lower raw milk supply in New Zealand and Europe. In spite of lower production, the intervention stocks in the EU increased to 350 000 t by early 2017 and have remained at that level.

Consumption of dairy products

The global population continues to grow at about 1,1% per year. The estimated per capita consumption of dairy products decreased marginally from 111,5 kg in 2015 to 111,1 kg in 2016. The decrease was caused by reduced purchasing power in oil-exporting countries, the Russian ban on dairy imports, and the economic downturn in South America.

There are major differences between different areas in terms of total annual milk consumption. Consumers in developed markets use up to 270 kg of dairy products per year, whereas African consumers use less than 50 kg. The

informal milk market is estimated at 45%, and the formal market consists of fresh and fermented products (17%), butter (15%), and cheese (13%). Based on data from countries that contributed to the report, *The World Dairy Situation 2016*, consumers in northern Europe and Oceania are the biggest consumers of liquid milk, drinking over 100 kg per capita per year. Europeans have the largest per capita consumption of butter while US, Israeli, and European consumers are the biggest cheese consumers.

“The global demand for dairy will grow by 20 million tonnes in 2018, of which 6 million tonnes will be as a result of population growth and 14 million tonnes as a result of increased per capita consumption.”

Figure 9: Share of key exporting countries in total trade in dairy products, 2000, 2015, 2016 (source: IDF Bull. 489/2017)

International dairy trade

In 2016 there was strong demand for butterfat with resulting increases in cheese and butter exports, which grew by 5,9% and 2,0%, respectively. The slower growth of the butter trade was caused by shortages as local demand exceeded local supply, thus limiting quantities available for export. The lower SMP prices also limited processors' ability to convert milk into cream and skimmed milk powder. This growth succeeded in clearing stocks built up in 2014 and 2015. The protein

market deteriorated, with decreases in the skimmed and full-cream milk powder trade of 3,1% and 2,5%, respectively. New Zealand remains the top supplier of dairy products, followed by the EU. The US export trade did not grow significantly, as production was largely used in the domestic market. The global secondary industry consists of several large multinational companies and many smaller companies operating in one or a few countries. Major international dairy companies are shown in Table 3.

International primary sector

There are 120 million dairy farms globally, with more than 60% of these in South Asia. With an average per farm population of five, this implies that 600 million people live on dairy farms. The average dairy farmer globally milks three cows. Larger dairy farms are found in Saudi Arabia, New Zealand, South Africa, Argentina, the US, and Canada. In South Africa the average number of cows in a herd was 354 in 2016. Average herd sizes (cows in herd) for various countries are shown in Table 4. After increasing to 125 million in 2013, dairy farm numbers are now decreasing at a rate of 1,4% per year. Dairy farms can be divided into three categories:

- household farms with between one and three cows, selling some milk and with dairy as one of a number of income sources;
- family farms with between 10 and 300 cows, where labour is mainly supplied by the farming family; and
- larger commercial farms with more than 300 cows, where the work is mainly done by employees.

“

The average dairy farmer globally milks three cows. Larger dairy farms are found in Saudi Arabia, New Zealand, South Africa, Argentina, the US, and Canada.”

In 2016, 63% of all dairy animals were kept by household farms, family farms kept 21%, and 16% were kept on larger commercial farms. Household farms are the dominant type in South Asia and Africa. In Latin

America, East Asia, and the EU, family farms predominate, with the larger commercial farms the dominant type in Oceanic countries and the US. South African dairy farms also fall into the commercial farm category.

Cost of milk production

This section is based on the analysis of typical dairy farms within the International Farm Comparison Network (IFCN). The IFCN is a network of dairy experts in many countries who strive to create a better understanding of milk production worldwide. Scientists from 105 countries contributed to the work of the IFCN in 2017. It analysed the production and cost of 159 typical dairy farms in 52 countries and published the results in the *IFCN Dairy Report 2017*. The comparison of farms is based on the actual income and cost figures for 2016. The MPO's participation in the work of the IFCN is partially sponsored by Milk SA.

The IFCN cost comparisons are based on full economic cost. Farm-produced feed is valued at a farm-gate price and not at production cost levels, and the farmer's own labour and management time is valued at comparable industrial rates. The inclusion of opportunity costs creates a bias towards countries with very little or no opportunity costs for labour and without viable markets for feed.

The average cost level of the 159 farms evaluated by the IFCN in 2016 stood at US\$38.4 per 100 kilograms of energy-corrected milk (100kg ECM), which is US\$3 below the 2015 level. Dairy farms in Africa, Latin America, the Central and Eastern European (CEEC) countries, Oceania, and the Middle East were able to produce milk at below-average

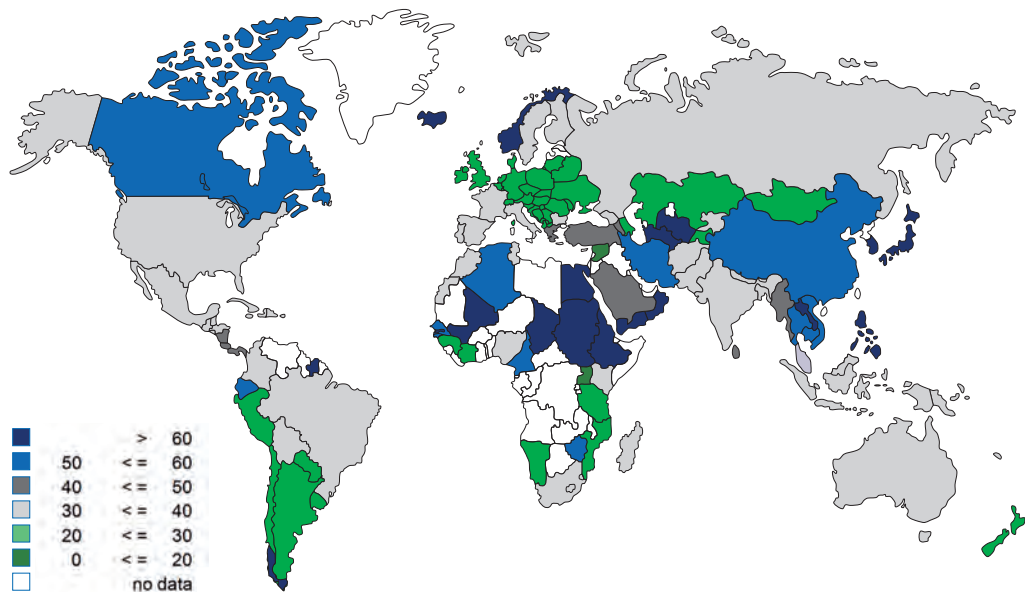

cost levels. Cost levels for dairy farms in Western Europe, North America, and Asia were significantly above the global average. Cost reductions in Africa, North America and the Middle East of more than US\$4 per 100 kg ECM were achieved through currency devaluation and, in some cases, through improved production efficiency. In Western Europe, a marginal cost reduction of US\$1 per 100 kg ECM was achieved. Within the different regions there is a huge variation between lowest and highest cost values. In Western Europe, cost levels range from US\$30 to US\$104 per 100 kg ECM, with an average of US\$50 per 100 kg ECM. In Oceania, the range is from US\$28 to US\$33 per 100 kg ECM, with an average of US\$30 per 100 kg ECM.

Feed is the highest single cost component, contributing about 64% to total cost. Feed costs and the efficient management of feeding practices have a big impact on total costs and play a huge role in determining cost competitiveness.

Milk production costs for typical dairy farms as analysed by the IFCN are shown in Figure 11. In countries with very low milk production costs, low opportunity costs of labour and lower feed prices are the main drivers of cost competitiveness. In most of these cases milk is produced for own use and not for sale.

“In most cases, countries with very low milk production costs produce milk mainly for home consumption or direct sales to neighbours.”

Figure 12: Estimated producer milk prices in various regions (US\$/100 kg ECM), 2016 (source: IFCN, 2017)

Producer milk prices

The key drivers of milk prices are the total milk supply, increased trade in dairy products between countries, growing demand for milk and, in the case of prices in individual countries, the exchange rates.

The IFCN World Milk Price Indicator, based on the weighted prices of major internationally traded dairy products, reached a low of US\$25 per 100 kg ECM in mid-2016 and increased to US\$36 per 100 kg ECM by June 2017. The average price decreased from US\$42 per 100 kg ECM in 2014 to US\$27 per 100 kg ECM in 2016.

Prices remain extremely volatile. The IFCN World Milk Price Indicator, based on the weighted prices of major internationally traded dairy products, stood at US\$33 per 100 kg ECM in December 2014. Prices trended between US\$22 and US\$27 per 100 kg ECM in 2015. Prices recovered after June 2016 and showed a steady upwards trend until February 2017. The main driver was a decrease in milk production, especially in major exporting countries. The rising trend was interrupted in March 2017 as markets reacted to record butterfat prices, and production increased. Prices increased again to reach a record US\$38,40 per 100 kg ECM in June 2017. The global milk supply, the impact of the higher butterfat prices, and developments regarding the EU's skimmed milk powder stocks will determine future price movements.

Producer prices in the countries analysed by the IFCN ranged from US\$17,70 per 100 kg ECM in Uganda to US\$150 per 100 kg ECM in Sudan. In 2016, 80% of countries reflected the declining trend in producer prices. In the EU, a declining trend was experienced

by all EU member states, but it was less marked than in 2015. The lowest prices were observed in Belgium. Prices also decreased in North and South America, except in Brazil, where prices increased. The highest prices were observed in Canada at US\$61 per 100 kg ECM, and the lowest in Uruguay at US\$29,10 per 100 kg ECM. Prices increased in New Zealand to a level of US\$26,90 per 100 kg ECM, marginally below the global average price.

SOUTH AFRICAN SITUATION

South African primary dairy sector

Structure of the primary dairy sector

The number of milk producers in South Africa decreased from 3 551 in January 2009 to 1 364 in January 2018. The number of producers per province is shown in Table 6. Since 2009, the number of producers has decreased by 62%. The biggest percentage decrease in producer numbers occurred in the Free State.

The trend towards higher production in the pasture-based areas has continued. The concentration of milk production per district is shown in Figure 13. Milk production per province, according to MPO estimates, taking into account the results of the October 2017 statutory survey, is shown in Table 7.

The number of cows varies widely among producers. The percentage distribution of herd size is shown in Figure 14.

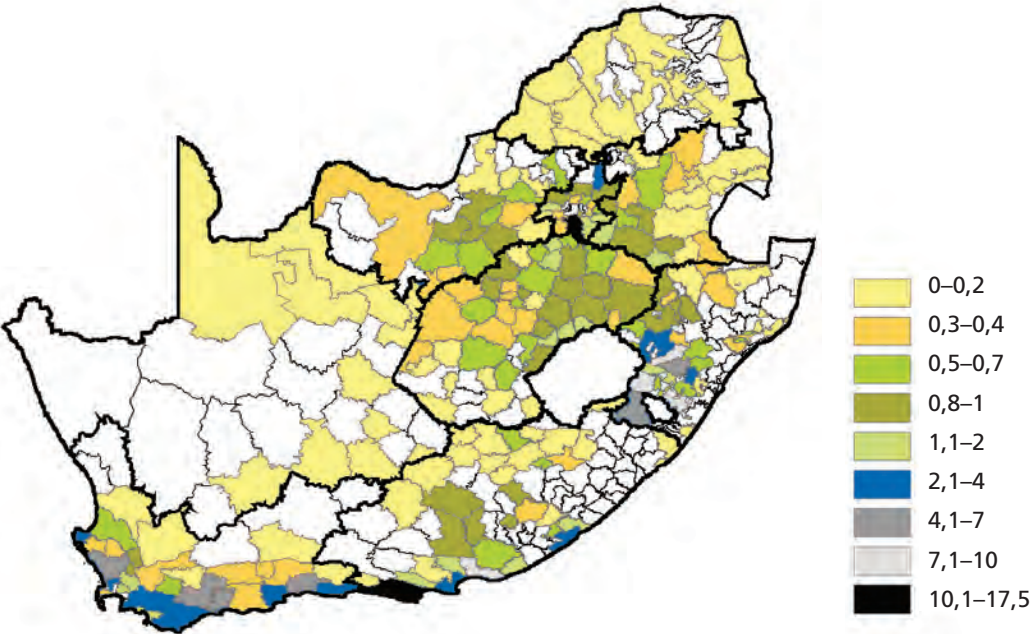

Figure 16: Distribution of herds based on daily production per cow in herd, 2015-2017 (source: MPO estimates from statutory surveys)

The average number of cows in milk per producer in the different provinces is shown in Table 7, and the concentration of cows per district in Figure 15.

Average milk production per cow per day was 20,0 l in 2017. A total of 98,5% of milk was delivered to the market. The balance was used for on-farm consumption. The distribution of herds on a production basis is shown in Figure 16.

“

The number of milk producers has decreased from 3 551 in January 2009 to 1 364 in January 2018. Since 2009, the number of producers has decreased by 62%.”

NEED TO KNOW

Change in total production per province (1997-2017)

Western Cape	+75%
Eastern Cape	+221%
Northern Cape	-13%
KwaZulu-Natal	+168%
Free State	-54%
North West	-72%
Gauteng	+25%
Mpumalanga	-66%
Limpopo	+49%

Milk production

Annual milk production shows a steady linear upward trend over time. The total milk to market for 2017 is 3 245 000 t,

2,7% up on the previous year. Monthly milk purchases in 2014 to 2017 are shown in Figure 17.

Figure 19: Composition of the South African liquid products market on a milk equivalent basis, 2016 (source: industry estimate supplied by Sampro)

Figure 20: Composition of the South African concentrated products market on a mass basis, 2016 (source: industry estimate supplied by Sampro)

South African secondary dairy sector

Structure of the secondary dairy sector

The South African secondary dairy industry consists of a few large processors operating nationally, a growing number of processors who operate in more than one region, a large number of smaller processors who operate in specific areas, and a number of milk producers who sell their own produce to retailers and consumers – known as producer-distributors (PDs). The number of PDs and milk buyers per province is shown in Table 9.

The number of producer-distributors decreased by 4,8% from 2008 to 2017. Milk buyers decreased by 18% over the same period.

Production and consumption

The South African dairy market is divided into 63% liquid and 37% concentrated

products. Pasteurised liquid milk and ultra-high temperature (UHT) milk are the major liquid products, while hard cheese is the major concentrated product. The estimated composition of the markets for liquid and concentrated products is shown in Figure 19 and Figure 20.

Imports and exports

Total dairy product imports and exports are shown in Figure 21 and Figure 22. In 2017, 83 504 t of products were imported. Total exports during 2017 were 48 627 t.

The total composition of imports and exports in 2017 is shown in Figures 23 and 24. On a mass basis, milk and cream were the most important products imported and exported.

Table 9: Number of producer-distributors (PDs) and milk buyers per province (indicated according to position of head office), as registered with Milk SA, 2008–2017 (source: Milk SA)

Province	Number of PDs					Number of milk buyers				
	Apr '16	Aug '16	Apr '17	Jul '17	Mar '18	Apr '16	Aug '16	Apr '17	Jul '17	Mar '18

Figure 25: Price index of raw milk on farm level, dairy products at processor level, and milk and eggs at consumer level, Jan 2012-Feb 2018 (source: Stats SA)

The South African dairy market is growing. Table 10 indicates changes in the size of the formal market for South African products, and changes in retail prices, as reported by Nielsen SA and collated by Sampro. The sales quantities of all products, with the exception of fresh milk, cream cheese, and butter, increased in the period. Total estimated liquid milk sales quantities (fresh and UHT) decreased by an estimated 1,3% during this period. The change in sales in a 12-month period for any product does not imply that quantities or prices changed at a uniform rate during the period.

The average retail prices of eight of the nine dairy products were higher in December 2017 than in December 2016. The retail prices of three of the eight products increased from December 2016 to December 2017 at a higher average rate than the inflation rate of 5,1% for the year which ended in December 2017.

In the year that ended in December 2017, the retail sales quantities of three of the nine dairy products were between 4% and 9% higher than in the previous year, but the sales quantities of six of the nine dairy products were lower than in the previous year. A change in sales in a 12-month period for any product does not imply that quantities or prices changed at a uniform rate over the whole period.

Figure 25 shows the trend in the price indices of unprocessed milk at farm level, dairy products at processor level, and milk, cheese and eggs at consumer level. Except for a period in 2015 when producer prices decreased relative to the other prices, prices follow the same general trend.

The South African dairy market
IS GROWING.

Table 10: Year-on-year change in retail demand and prices of dairy and other food products (source: Nielsen as supplied by Sampro)

Product	Change in demand (quantity) per cent Jan '17-Dec '17 vs Jan '16-Dec '16	Change in retail prices per cent Dec '17 vs Dec '16
Fresh milk	-3,7	-0,5
Long-life milk (UHT milk)	-9,0	0,7
Flavoured milk	-6,7	3,9
Yoghurt	-0,1	0,1
Maas	4,0	0,9
Pre-packaged cheese	8,2	2,1
Cream cheese	-9,8	9,2
Butter	-5,5	28,3
Cream	-0,1	11,2
Instant cereals	5,9	-1,7
Bread	5,1	-3,7
